

ABUL KHAIR LEAF TOBACCO CO LTD.

ABUL KHAIR LEAF **TOBACCO COMPANY LTD.**

LEAF OPERATION

The leaf operations of Abul Khair are spread across all major tobacco-growing areas of the country. Abul Khair has a contractual farmer base of approximately 50,000 farmers, cultivating tobacco on around 60,000 acres and producing about 50 million kilograms of tobacco.

Our leaf operations are supported by a field force of approximately 370 personnel, who provide end-to-end supervision at the farmer level — from seedbed preparation to curing, green leaf procurement, classification, and storage. We have a warehousing capacity of approximately 60 million kilograms of tobacco across various locations.

FLUE CURED VIRGINIA

FCV-NC 95

The NC-95 variety has been cultivated in Kushtia for an extended period, yielding approximately 750 to 800 kg per acre. It is widely recognized for its high-quality neutral filler properties, making it a preferred choice for tobacco blending.

In terms of chemical composition, NC-95 has a low to low-medium nicotine content, ranging from 0.8% to 1.6%, and a medium sugar level, typically between 9.0% and 15.0%. This combination enhances its suitability as a neutral filler, ensuring a refined and consistent smoking experience.

FLUE CURED VIRGINIA

FCV-K326

K326 is a premium American tobacco variety cultivated in Meherpur, Jhenaidah, and parts of Kushtia, located in the northwestern region of Bangladesh. This variety is known for its medium to high nicotine content and a distinctive color spectrum, ranging from lemon-orange to deep orange. With a soft texture and well-balanced composition, it is highly valued in cigarette manufacturing.

K326 exhibits a medium to heavy body, providing a rich yet balanced smoking profile. Its nicotine content ranges from 2.0% to 3.8%, while its sugar content falls between 6.0% and 10.0%, contributing depth to its flavor. These characteristics distinguish K326 and reinforce its reputation as a high-quality tobacco variety.

FLUE CURED VIRGINIA

SPG28

SPG28 Tobacco is a flue-cured Virginia (FCV) variety recognized for its semi-flavor, high combustibility, and natural sweetness. It typically produces thin- to medium-textured leaves with excellent curing qualities, making it highly suitable for premium cigarette blends.

In terms of chemical composition, SPG28 generally contains nicotine levels ranging from 1.2% to 2.8%, with a high sugar content (8–12%), which imparts a smooth, sweet smoking profile. Its desirable aroma, bright leaf color, and good burning characteristics make it a preferred choice for manufacturers seeking consistency and quality in Virginia tobacco grades.

AIR CURED VIRGINIA

Burley

Burley tobacco is an air-cured variety known for its distinct characteristics and smooth smoking profile. It has a thin to medium body, making it a versatile component in tobacco blends.

In terms of chemical composition, Burley tobacco contains nicotine levels ranging from 2.0% to 3.5%, offering balanced strength suitable for a wide range of tobacco products. Its mild yet full-bodied nature makes it a key ingredient in both cigarette and pipe tobacco formulations.

SUN CURED VIRGINIA

Jati

Jati is a traditional Bangladeshi sun-cured tobacco variety known for its heavy body and strong smoking characteristics. The leaves display a brown to dark brown color, reflecting their rich, robust nature.

Widely used in bidi production, Jati tobacco remains a staple in traditional tobacco markets, valued for its strength and distinctive smoking qualities.

SUN CURED VIRGINIA

Talim

Talim is a traditional Bangladeshi air-cured tobacco variety known for its heavy body and strong smoking characteristics. The leaves range in color from brown to dark brown, highlighting their rich and robust nature.

Primarily used in bidi production, Talim tobacco is valued for its potency and distinctive profile, making it a key component of traditional tobacco markets.

SUN CURED VIRGINIA

Dark Virginia (DV)

It has traditionally been cultivated for use in bidi production. This variety is characterized by its full-bodied nature, exhibiting a rich brown to dark hue. With a nicotine content ranging from 2.5% to 3.5% and a sugar level of 1.5% to 2.5%, DV tobacco delivers a distinctive smoking experience. Notably, manufacturers do not engage in its cultivation, sourcing it instead from independent growers.

Dark Virginia (DV) is a full-bodied tobacco variety distinguished by its rich brown to dark color. With a nicotine content ranging from 2.5% to 3.5% and a sugar level of 1.5% to 2.5%, this tobacco delivers a bold and distinctive smoking experience.

SUN CURED VIRGINIA

Motihari

Motihari is a native Bangladeshi air-cured tobacco variety known for its heavy body and distinctive round-shaped leaves. It features a brown to dark color, reflecting its rich and robust nature.

Widely used in bidi production, this versatile tobacco is also commonly utilized as chewing tobacco, making it a significant component of traditional tobacco consumption.

GLT PLANT

GLT-Green Leaf Threshing is a processing plant that processes green leaf for cigarette factories and export. The factory was established in 1993 in Uttam (Rangpur), located 6 km from Rangpur town near the Rangpur-Dinajpur highway.

The GLT plant has a capacity of 10,000 kg/hr. The plant receives raw tobacco directly from farmers through purchase, which is then brought to the plant for threshing.

First, the tobacco is placed on the feed table. After maintaining the required moisture, it goes to the thresher, where the midrib (stem) and lamina are separated.

Next, the separated lamina is sent to the lamina dryer for drying and moisture control before being packed in 200 kg bales using the auto press.

Separately, the stem goes to the stem dryer for drying and packing. Process line scrap (small lamina) is dried and packed in 50 kg bags.

Finally, all products are cooled for 72 hours before being sent to the company's warehouse for storage.
